

Generates ITSG-33 control narratives

April 22, 2026 3:55 PM

This is an idea coming from Richard Tremblay

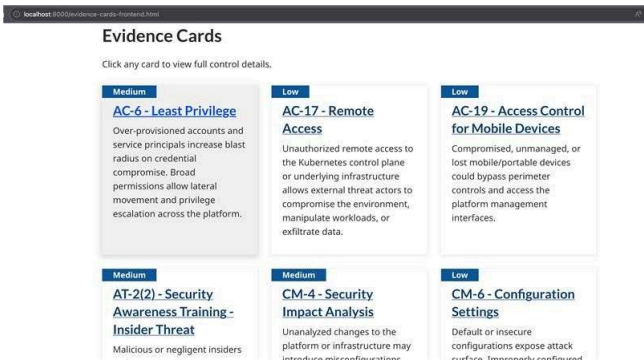

I was able to PULL together a LOT of detailed ITSG-33 control narratives with code mapping to IaC by pointing an LLM at the opensource Aurora code repos.....it read through terraform and helm charts and build a pretty strong results.

the nice thing for me is I am doing this 100% from public github stuff so I didn't feel too bad about doing it with my home data/access.

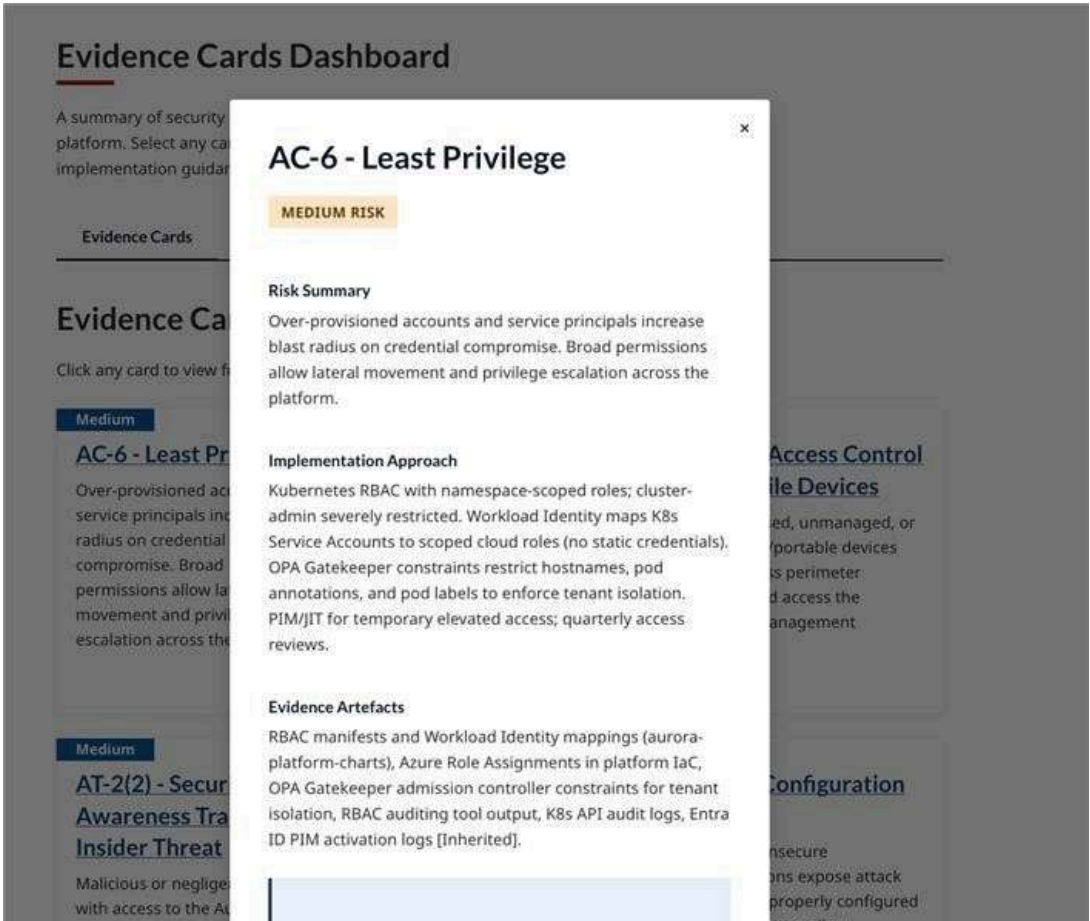

Sharing best practice and developed skills or agents (in my work I used Claude agents, but these can be converted to skills or pulled in as instructions directly ...

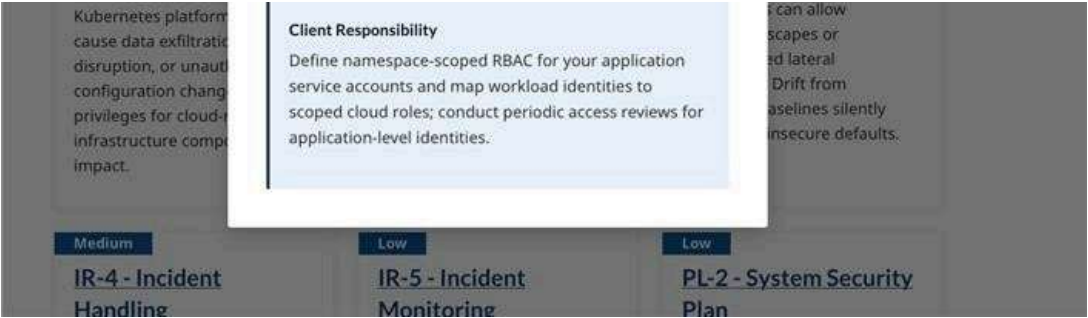

My AGENTS.md file for example this work that points to some templates agents and files (like my system boundary statement). All or some of that might be helpful to others doing aligned work.

I also did my PoC for how we could actually SHARE some of this stuff....

with more summarized (and hopefully totally safe to publish) summaries that include "what you as a client need to do"....

that more summarized view -- is again feeding all the completed narratives to the LLM with instructions to create the summary.
